

# **Expanding Brackets** and **Simplifying Expressions**

#### A LEVEL LINKS

**Scheme of work:** Ch2-1. Algebraic expressions – basic algebraic manipulation, indices and surds

## **Key points**

- When you expand one set of brackets you must multiply everything inside the bracket by what is outside.
- When you expand two linear expressions, each with two terms of the form ax + b, where  $a \neq 0$  and  $b \neq 0$ , you create four terms. Two of these can usually be simplified by collecting like terms

# **Examples**

#### **Example 1** Expand 4(3x - 2)

Multiply everything inside the bracket by the 4 outside the bracket

#### **Example 2** Expand and simplify 3(x+5) - 4(2x+3)

$$3(x+5)-4(2x+3)$$

$$= 3x+15-8x-12$$

$$= 3-5x$$
1 Expand each set of brackets separately by multiplying  $(x+5)$  by 3 and  $(2x+3)$  by  $-4$ 
2 Simplify by collecting like terms:  $3x-8x=-5x$  and  $15-12=3$ 

#### **Example 3** Expand and simplify (x + 3)(x + 2)

$$(x+3)(x+2)$$

$$= x(x+2) + 3(x+2)$$

$$= x^2 + 2x + 3x + 6$$

$$= x^2 + 5x + 6$$
2 Simplify by collecting like terms: 
$$2x + 3x = 5x$$

### **Example 4** Expand and simplify (x-5)(2x+3)

(x-5)(2x+3) = x(2x+3) - 5(2x+3)	1 Expand the brackets by multiplying $(2x + 3)$ by $x$ and $(2x + 3)$ by $-5$
$= 2x^2 + 3x - 10x - 15$ $= 2x^2 - 7x - 15$	2 Simplify by collecting like terms: $3x - 10x = -7x$
